# Azure CDN (Portal)
(LAB-300-01A-06)

Part A: Create CDN Profile

1. Locate your storage account created in the previous lab in the Azure portal and display the overview.

2. Select **Azure CDN** under the **Blob Service** menu to configure Azure CDN.

3. In the **CDN profile, configure the C**DN profile settings, use the following:

   a. Select **Create New** & provide CDN name

   b. In **Pricing tier**, select **Standard Akamai**

   c. In **CDN endpoint name**, provide endpoint hostname. The CDN endpoint must be unique across Azure.

   d. In **Origin hostname,** specify your static website endpoint, created in previous lab. Copy the primary endpoint and paste it into the CDN configuration, removing the protocol identifier (*e.g.*, HTTPS).

   e. Select **Create**

Part D: Access CDN Endpoint

Because it takes time for the registration to propagate, the endpoint isn't immediately available for use.

4. Open **CDN Endpoint**, which you have created in previous step

5. Go to the right side, copy the **URL link** under Endpoint Hostname

6. Open the URL from browser
